

Voter Paradox in the 2009 Burlington IRV Mayoral Race

	1st	2nd	3 rd	4th	5th	totals	%	vote dif	winner
Montroll over Wright	2063	1788	644	100	2	4597	56%	929	Montroll
Wright over Montroll	2954	570	126	17	1	3668	44%		
Kiss over Montroll	2586	657	207	28	0	3478	46%	589	
Montroll over Kiss	2063	1316	568	118	2	4067	54%		Montroll
Kiss over Wright	2586	1123	521	77	7	4314	51%	250	Kiss
Wright over Kiss	2954	760	308	42	0	4064	49%		

This table provides compares the top 3 candidates in the 2009 Burlington mayoral race on the basis of voter preference of one over another. The figures are the number and percent of ballots on which one candidate was preferred over the other. The columns listed as "1st", "2nd", "3rd", "4th" and "5th" contain the number of ballots in which the candidate was ranked above their opponent. The column "1st" includes each candidate's 1st place votes. The column "2nd" contains each candidate's 2nd place votes minus their 2nd place votes that they received from voters who ranked their opponent 1st. The column "3rd" contains each candidate's 3rd place votes minus 3rd place votes received from voters who ranked their opponent 1st or 2nd. Etc. The totals are the sum of all of the ballots that ranked the candidate over their opponent regardless whether it was in the 1st and 2nd ranking or the 3rd and 4th ranking or whatever combination. The raw numbers used for this calculation are attached below in the form of crosstabs.

The table demonstrates that **a majority of voters ranked Andy Montroll above Kurt Wright (56% to 44%) and Bob Kiss (54% to 46%)**. That is more voters preferred Montroll to Wright and Montroll to Kiss. Despite this, Bob Kiss won the election after the ballots for all the candidates but Kurt Wright were reallocated in the final round of the IRV process. In other words, the IRV election resulted in a Thwarted-Majorities Paradox in which a candidate that can beat every other candidate in direct-comparison lost the election.¹

The following tables are crosstabs matching up voters' rankings (CH1 = voters' first choice, CH2 = voters second choice, CH3 = voters third choice, etc.). So, the first table matches up voters' 1st choice with their 2nd choice, the second table matches up voters' 1st choice with their 3rd choice, etc. An example of interpretation of the numbers (1st table): 1321 voters for whom Kiss was their first choice picked Montroll for their second choice (data row 1, column 2), 119 voters for whom Kiss was their first choice picked Simpson for their second choice (row 1, column 3), etc.
